

Human Evaluation Guidelines

Task Description

Annotators are presented with two peer-review texts (Review A and Review B) written for the same paper. The task is to determine which review exhibits higher overall quality based on five evaluation dimensions. Ties are allowed only when the two reviews are genuinely indistinguishable in quality.

Evaluation Dimensions

1. Comprehensiveness

The extent to which the review provides a structured and complete evaluation of the paper.

Consider which review better summarizes contributions, covers relevant aspects, and is well organized.

2. Constructiveness

The degree to which the review offers actionable and helpful feedback.

Consider which review explains weaknesses clearly and provides concrete suggestions.

3. Substantiation

The extent to which evaluative claims are supported by reasoning or evidence.

Consider which review justifies claims and refers to specific parts of the paper.

4. Confidence

The clarity and decisiveness with which evaluative judgments are communicated.

Confidence does not imply overconfidence; appropriate hedging is acceptable.

Consider which review is clearer, less vague, and more coherent.

5. Kindness

The professionalism and respectfulness of the tone.

Consider which review avoids dismissive language and critiques the work rather than the authors.

Annotation Procedure

For each review pair:

- Read both reviews carefully.
- Compare them holistically using the five dimensions.
- Select one option: Review A is better / Review B is better / Tie.

Additional Instructions

Focus only on the review text. Do not consider acceptance decisions or personal agreement with the review content.

Output Format

For each pair, provide a single label: A, B, or Tie.
