

Human Evaluation Guidelines for Peer Review Quality

Task Description

Annotators are presented with two peer-review texts (Review A and Review B) written for the same paper.

Your task is to determine which review demonstrates higher overall quality as a peer review, based on independent human judgment.

Important:

- The evaluation principles below are general principles of good peer review practice, not a scoring rubric.
- You are not required to assign numerical scores.
- You are not required to weigh dimensions equally.
- You may determine which aspects matter more in the specific comparison.

Ties are allowed only when the two reviews are genuinely indistinguishable in quality.

Evaluation Principles (Guiding Prompts, Not a Scoring Rubric)

1. Coverage and Structure

Does the review meaningfully engage with the paper's main contributions, claims, methods, and experiments?

Is it organized and sufficiently complete?

2. Helpfulness and Actionability

Does the review provide specific suggestions or concrete feedback that could help improve the paper?

3. Justification and Specificity

Are the reviewer's claims supported with reasoning, examples, citations, or references to specific parts of the paper?

4. Clarity and Decisiveness

Are the reviewer's evaluations clearly stated and coherent?

Does the review avoid vagueness or ambiguity?

5. Professional Tone

Is the review respectful and professional?

Does it critique the work rather than the authors?

Important Clarifications:

- These principles are provided to promote consistency, not to mirror or validate any automated scoring framework.
- Annotators should rely on their independent academic judgment.
- If one review excels in one aspect but is substantially weaker in another, annotators should decide which weaknesses matter more for overall quality.
- No assumption should be made that all principles contribute equally.

Annotation Procedure

For each review pair:

1. Read both reviews carefully.
2. Reflect briefly on the strengths and weaknesses of each review.
3. Determine which review, overall, better fulfills the role of a high-quality academic peer review.

Output Format

For each pair:

Preference label: A or B
